

Sell to AI Buyers (Frontend Design)

A polished, animated storefront. A person asks the AI to buy, sees recommendations, consents, pays — with a safe approval and a verified Passport. The AI can think; it can never move money alone.

S1 · AI buyer chat (animated)

Enter: natural language in the chat box ("Find running shoes under ₹4,000").

See: the secure header with a **pulse**, a **loading spinner**, and **typing dots** while the AI works — then it states it only shows real store prices.

"Find running shoes under ₹4,000 for daily running."

PARSED INTO A STRUCTURED QUERY (JSON)

```
{
  "action": "discover & buy",
  "product": { "type": "running_shoes", "category": "shoes/running"
},
  "quantity": 1,
  "budget_max_minor": 400000,
  "attributes": { "use_case": "daily_running" }
}
```

✓ **validated** This JSON is checked (typed schema) before it is used. It is **untrusted input**.

USED TO SEARCH THE MERCHANT CATALOG (POSTGRESQL)

```
SELECT * FROM products
WHERE tenant_id = :store
  AND status = 'active'
  AND category = 'shoes/running'
  AND price_minor <= 400000;
```

Found 3 Prices come from the database — the AI never makes them up.

S1b • Parse → JSON → database search (the core)

The pipeline: customer text → LLM parses it → a **structured JSON intent** → validated → a **real search** over the merchant's catalog (by category, price ≤ budget, active).

Safety: the JSON is untrusted and schema-checked; the search is parameterized; results use **server-owned prices** only. This same intent is hashed into the **Transaction Passport** for proof later.

Trail One 43

shoes/trail · low stock

₹499

Add to cart

₹3,899

Add to cart

Why these? Based on your ask, budget and store availability. Prices are real.

S2 · Recommendations

Enter: "Add to cart". The AI can only add what the store sells at the store price.

See: a **shimmer** loading state while results stream, then cards that **lift on hover**. The "best pairing" hint comes from the growth engine — never an upcharge.

```

S7 · Transaction audit trail (everything is visible)

See: the full timeline of this purchase — intent → cart → policy → risk → authorization → order → payment → success → Passport verified, each with a hash.

Why it matters: this is the one place a customer or auditor can see **every** step and prove the AI never moved money on its own. It is append-only and tamper-proof.
