

AEGISPAY — GROW

The merchant revenue agent (simplified)

How AI safely grows a merchant's revenue — in one minute.

The one-minute flow

Figure 1 — From sales data to a measured, budget-limited campaign

- 1 **Merchant data.** Read grouped sales (no customer PII needed).
- 2 **Find an opportunity.** Real correlation: people who buy shoes often buy socks.
- 3 **AI proposes an offer.** A small cross-sell, a discount, a target group, a budget.
- 4 **Check fixed rules.** Max discount, max budget, minimum margin, contact frequency.
- 5 **Estimate uplift.** An honest range (e.g. +3% to +8%), never a fake promise.
- 6 **Merchant approves.** The AI cannot start it by itself.
- 7 **Run inside budget.** It stops the moment the budget is spent.
- 8 **A/B test.** Some customers get the offer, some don't.
- 9 **Measure real uplift.** Compare the two groups, not a guess.
- 10 **Learn.** Repeat what worked, drop what didn't.

The rule that makes it safe: **the AI proposes; a merchant decides; fixed rules always bind.**

What it does and what it never does

GROW does	GROW never does
Suggest cross-sells, upsells and bundles	Change a price on its own
Draft a campaign with a capped budget	Exceed the approved budget
Propose discounts under a cap	Give an unlimited discount
Estimate revenue with a range	Guarantee a number
Ask the merchant to approve	Approve its own campaign
Contact customers within a limit	Spam customers

The fixed rules

Figure 2 — Every proposed offer is filtered by fixed limits before a human sees it

These limits are set by the merchant and cannot be changed by the AI. That is what stops a bad idea before it becomes a bad spend.

Budget ledger (no overspend)

Figure 3 — The campaign spends only up to its budget, then pauses

A campaign has a budget and a spent counter. Every discount costs against it. When spent reaches the budget, the offer stops by itself.

Honest revenue measurement

A/B test: a control group (no offer) vs a test group (offer).

Incremental revenue = test group – control group, so you see the real effect.

Results are labelled as estimates; we never present a plausible guess as a fact.

Human approval + kill switch + audit

Every campaign needs a merchant approval before it runs.

A global kill switch can stop all campaign spending instantly if needed.

Every proposal, approval, spend and result is written to the tamper-evident audit trail.

Why AegisPay is difficult to reject

The AI can reason and recommend, but only AegisPay's deterministic control plane can authorize and execute financial actions. That is the whole product.

It is safe by design, not by promise. The AI has no money keys and no payment endpoint — only a request that is always checked.

It handles failure honestly. Unknown payments are reconciled rather than blindly retried; duplicates are designed out, not hoped away.

You can prove it. Every decision is written to a tamper-evident audit ledger and a Transaction Passport.

It is simple to run. One FastAPI service, PostgreSQL + Redis + one queue on AWS ECS — no unnecessary complexity.

It grows and sells. GROW lifts revenue with bounded risk; SELL lets AI buyers transact end-to-end. PROTECT keeps both safe.
